

**AMENDMENTS TO THE CLAIMS**

1. (Canceled)

2. (Currently Amended) An organic light emitting device having a plurality of emission layers between an anode and a cathode,

    said emission layers being separated from each other by an equipotential surface forming layer or a charge generating layer,

    wherein said organic light emitting device further comprises:

    an optically-transparent substrate having a first surface and a second surface; and

    a light scattering means, at least either inside or outside the device, for scattering light emitted from said emission layers,

    wherein a first electrode of said anode or said cathode is an optically-transparent electrode having a first surface and a second surface, and the second surface of the first electrode is mounted on the first surface of the optically-transparent substrate,

    wherein a second electrode of said anode or said cathode has a first surface, and a second surface of the second electrode is mounted on the first surface side of the first electrode so that said emission layers intervene between the first surface of the first electrode and the second surface of the second electrode, and

    wherein said light scattering means is the second electrode which is a light scattering and light-reflective electrode,

wherein said organic light emitting device further comprises a layer having a first surface, and a second surface provided on the emission layers so that said layer intervene between the emission layers and the second surface of the second electrode, said layer having variations of a film thickness of the layer, said layer and the second surface side of the second electrode forming the light scattering means.

3. – 5. (Canceled)

6. (Previously Presented) An organic light emitting device having a plurality of emission layers between an anode and a cathode,

    said emission layers being separated from each other by an equipotential surface forming layer or a charge generating layer,

    wherein said organic light emitting device has, at least either inside or outside the device, a light scattering means for scattering light emitted from said emission layers, and

    wherein said light scattering means is made up by forming said equipotential surface forming layer or said charge generating layer so that it has a light scattering property.

7. (Previously Presented) An organic light emitting device having a plurality of emission layers between an anode and a cathode,

    said emission layers are separated from each other by an equipotential surface forming layer or a charge generating layer,

    wherein said organic light emitting device further comprises an optically-transparent substrate having a first surface and a second surface,

    wherein a first electrode of said anode or said cathode is an optically-transparent electrode having a first surface and a second surface, and the second surface of the first electrode is mounted on the first surface of an optically-transparent substrate,

    wherein a second electrode of said anode or said cathode is an optically-transparent electrode having a first surface and a second surface, and the second surface of the second electrode is mounted on the first surface side of the first electrode so that the emission layers intervene between the first surface of the first electrode and the second surface of the second electrode,

    wherein a light reflective element is provided on the first surface side of the second electrode,

    wherein an optical spacer is provided between the first surface of the second electrode and the light reflective element,

wherein a distance between said light reflective element and said emission layers is in the range of 1 $\mu$ m to 1mm by means of the optical spacer so as to be set to a distance where an angle dependency of light emission brightness and light emission color can be reduced.

8. (Previously Presented) The organic light emitting device as set forth in claim 6, wherein said plurality of emission layers comprises emission layers of at least two different emission colors.

9. (Original) The organic light emitting device as set forth in claim 8, wherein an emission color of the organic light emitting device is white.

10. (Original) The organic light emitting device as set forth in claim 7, wherein said plurality of emission layers comprises emission layers of at least two different emission colors.

11. (Previously Presented) The organic light emitting device as set forth in claim 10, wherein an emission color of the organic light emitting device is white.

12. (Canceled)

13. (Original) The organic light emitting device as set forth in claim 7, wherein the light reflective element is a multilayered film of a dielectric.

14-17. (Canceled)

18. (New) The organic light emitting device as set forth in claim 2, wherein the layer between the emission layers and the second surface of the second electrode is an electron injection layer.

19. (New) An organic light emitting device having a plurality of emission layers between an anode and a cathode,

said emission layers are separated from each other by an equipotential surface forming layer or a charge generating layer,

wherein said organic light emitting device further comprises an optically-transparent substrate having a first surface and a second surface,

wherein a first electrode of said anode or said cathode is an optically-transparent electrode having a first surface and a second surface, and the second surface of the first electrode is mounted on the first surface of an optically-transparent substrate,

wherein a second electrode of said anode or said cathode is an optically-transparent electrode having a first surface and a second surface, and the second surface of the second electrode is mounted on the first surface side of the first electrode so that the emission layers intervene between the first surface of the first electrode and the second surface of the second electrode,

wherein a light reflective element is provided on the first surface side of the second electrode,

wherein an optical spacer is provided between the first surface of the second electrode and the light reflective element,

wherein the optical spacer is a single layer made from two or more material components having different refractive indexes from each other.
